# PDR Algorithm: Preliminaries

---

- A **control flow graph (CFG)**  $A = (X, L, E, \ell_0, \ell_E)$  is a graph consisting of
- Finite set of **first-order variables**  $X$
  - Finite set of **locations**  $L$
  - Finite set of **transitions**  $E \subseteq L \times FO \times L$ 
    - ➔  $FO$  is a **quantifier free first-order logic formula** over variables in  $X$  and  $X' = \{x \in X \mid x' \in X'\}$
  - **Initial location**  $\ell_0 \in L$
  - **Error location**  $\ell_E \in L$

# PDR Algorithm: Datastructures

---

## ➤ Frame $F_{i,\ell}$ :

- Represents a first-order formula
  - $\ell$  is the corresponding location
  - $i$  is the corresponding iteration
- ➔ Each location has multiple assigned frames

## ➤ Proof-Obligation $(p, \ell, i)$ :

- $p$  is a first-order formula
  - $\ell$  is the corresponding location
  - $i$  is the corresponding iteration
- ➔ Need to be blocked

# PDR Algorithm: Description

---

- Starts with checking for a **0-Counter-Example**
- **Global Initialization**
- Repeats three phases until termination:
  1. **Next Iteration Initialization**
  2. **Blocking-Phase**
  3. **Propagation-Phase**

## Example: Running Example

---

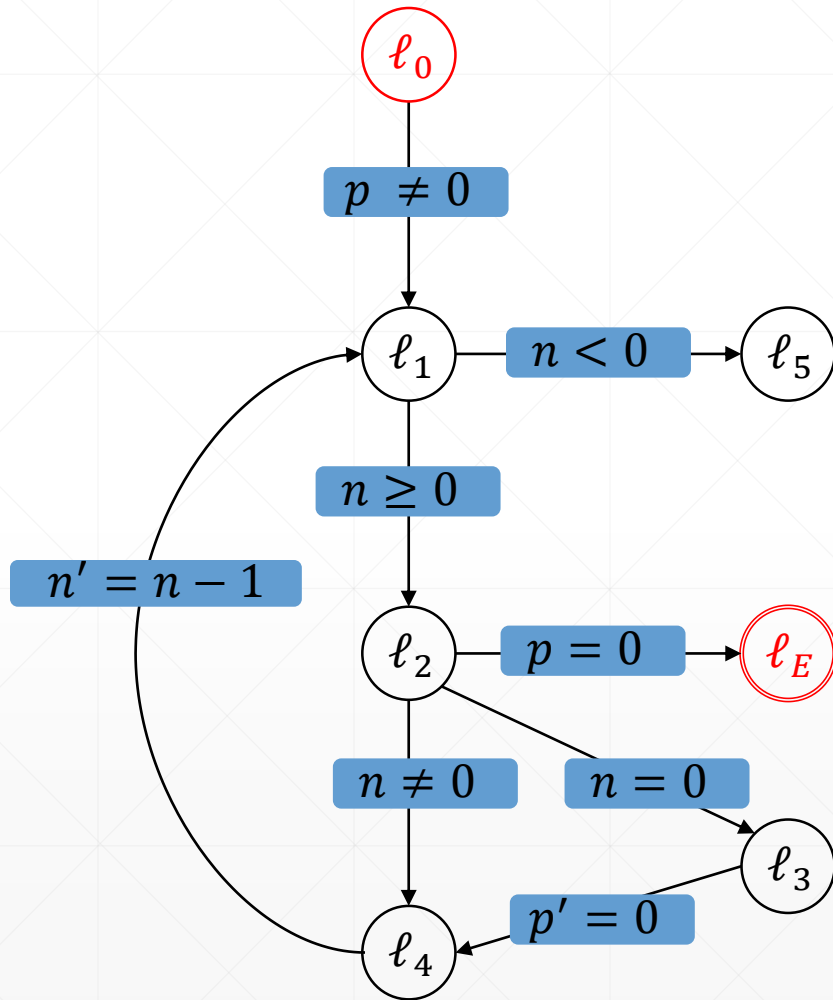

## Example:

1. **Step:** Check for 0-Counter-Example

## Example:

### 1. Step: Check for 0-Counter-Example

- Is  $\ell_0 = \ell_E$  ?
  - ➔ No, continue with initialization

## Example:

## ➤ Skipping already blocked proof-obligations:

- Cache unsatisfiable queues to SMT-solver

  - ➔ If a cached query is seen again, do not call SMT-solver again, strengthen frames right away

# Evaluation: Discussion

---

# Future Work: Implementing Further Improvements

---

## ➤ Using Interpolation:

- Our algorithm is inefficient when dealing with loops

- **Idea:**

- Instead of strengthening frames with negated proof-obligation, calculate Interpolant for transition and proof-obligation and add that

# Future Work: Implementing Further Improvements

---

## ➤ Dealing with procedures:

- C programs often contain procedures with which PDR cannot deal

- **Ideas:**

1. Use a non-linear approach of PDR
2. Calculate a procedure summary, add that to the CFG, removing the procedure altogether

# Conclusion

---

➤ We have seen:

- How PDR works on software
- How we combined Trace Abstraction and PDR
- How the combination compared to Trace Abstraction with Nested Interpolants
- What can be done to make it more efficient
